

User Guide to Spekify:-

Spekify is a music album database + suggester application. Here is how to use it:-

The user is requested to launch the program through the LAUNCHER.exe file, it is used to by default open SPEKIFY.exe in maximized mode.

The main menu:-

This is the main menu of the program. The user can guide themselves through the menus of SPEKIFY through entering the numbers corresponding to their choices. It gives the user the following options:-

- 1.) View the existing database -> View the entire database, or a section of it, or search an album.
In the entire database option user can pick how he wants the music albums sorted.
In the view a section option, user can choose based on what details would he like to view a section -> Based on genre, year range, or an artist.
- 2.) In the create profile option, user is first asked to enter a name of the profile, the .txt file of which name is created in the same folder as the program. Then user is asked to enter details of his albums one after the other, based on which entries are added to the .txt file. User can always exit by entering 0, and return to the main menu. The character limits given on the instructions inside the program should not be ignored, otherwise, it might result in some unexpected bugs.
- 3.) Load a profile works on a similar principle, user is first asked to enter the name of profile to load, then he is provided with an option to print the data stored in the profile sorted as he prefers. Only after picking the preference the application tells you if such a file even exists, or not.

- 4.) The Album suggerter works on the existing database, therefore it can only offer the user 3 genres to be suggested an album from. The user has to choose a genre, and then pick 3 adjectives that he likes from a list of 20 adjectives, based on which he is suggested an album.
- 5.) The Theme option allows the user to change the colours of the screen. There is a premade list of themes among which the user can choose, alternatively, the user can assign a custom theme as well, by entering the codes of the colours as described on the screen.
